Cover Letter

Over the last few years I've been building cool projects across full-stack development, backend engineering and cloud infrastructure, with a focus on solving practical problems and taking projects from development to deployment. I've worked with frontend interfaces, REST APIs, database design, authentication, server-side logic and Linux-based deployments, with focus to code quality, performance and reliability. Yeti Jobs, a productionised hiring platform, involved building full-stack features, 50+ REST APIs, role-based access control and PostgreSQL optimizations, followed by deployment on AWS EC2 using Docker, Nginx and GitHub Actions, maintaining 99.5% uptime over three months.

Daigo, a carpooling platform I'm building, which include a route matching, authentication, Redis-based real-time communication and transaction handling, with a focus on dependable backend workflows. I've worked on these as productionised solutions using JavaScript, TypeScript, React, Node.js and PostgreSQL, and also Python, Docker, AWS, Linux and Redis. I've also led teams at SIH and DigiMantra hackathons and won CodeaThon 7.0, a coding competition with 120+ participants.

Thanks.
